Flood Situation Report

Area: 6.707°N 80.356°E (107.6 km²) Flood date: 2017-05-30 Generated: 2026-10-04 09:13 UTC

Flood / debris impact detected

Educational prototype generated automatically from satellite data. Not an official emergency map.

2.79 km²	0.00 km²	0	0.4 km	0	0
Flood water	Debris / mud	Buildings likely hit	Roads affected	Bridges hit	Settlements cut off

Settlements that lost or changed road access to a hospital

No mapped settlement lost its road connection to a hospital.

Data used

• Sentinel-1 radar: before 2017-01-24, after 2017-05-30 (track des-019, 126 days apart)
• Sentinel-2 optical: not used (cloud or unavailable)
• OpenStreetMap as of 2017-01-24 (before the event)
• AI segmentation model: used, combined with rule-based detection
• Debris class only in mountain terrain (UNEP-WCMC definition); 2% of this area is mountain

Confidence and limits

• 2.35 km² of the flood/debris area is medium or high confidence.
• Sentinel satellites revisit an area only every few days: this system maps damage after the fact and cannot warn of a sudden glacier or lake outburst. Areas marked grey were hidden from the radar and are unknown, not safe. Road access uses mapped roads only. 'Likely cut off' rests on low-confidence detections; 'Unknown' means the last route crosses roads the radar could not see. Travel times use nominal speeds per road class. Rows are ranked by priority: certainty, settlement size (mapped buildings), extra time.
• Before-images taken on or before 2017-01-24 (set by the operator: the area was still dry then). Change between that date and the after-image includes the whole build-up of the flood, and also any other change in that period (crops, construction).
